

# MILLER BATH

Kansas City, MO | (913) 433-3711 | millerzbath@gmail.com

linkedin.com/in/millerbath | github.com/bath | mzb.dev

## TECHNICAL SKILLS

---

**Languages** | Python, Java, Go, JavaScript

**AI / LLM** | AI agent orchestration, FastAPI, LangChain, Pydantic

**Backend** | Kafka, MongoDB, DocumentDB, GraphQL, JAX-RS, REST

**Frontend** | React, webpack

**Infrastructure / Delivery** | Kubernetes, AWS, ArgoCD, GitHub Actions, Snyk, OpenTelemetry, Gradle

## EXPERIENCE

---

### Software Engineer II, PayIt

Oct 2024 – Present

*Payments platform, reliability, and applied-AI tooling*

- Led **Payment Plans** from zero to production as primary engineer — a recurring-payment platform across four backend services (Java, Kafka, MongoDB) with idempotent Kafka consumers and full refund / cancellation policy logic; delivered **4 weeks early**, **\$15M+ processed** to date, with rollout projected to add **\$400K ARR**
- Built an internal **LLM prompt-management system** (FastAPI, DocumentDB, LangChain) — immutable prompt versioning, weighted A/B routing, and a single-active-version invariant enabling **safe canary rollout** of prompt changes in production
- Joined skunkworks team **Daedalus**, building a Go (Cobra) CLI that gives AI coding agents a constrained, machine-readable interface to an internal knowledge base
- Contributed to an internal **AI agent orchestrator** for targeted roadmap goals — used it to **migrate 100+ Java microservices** to Java 25 in **4 weeks**
- Diagnosed and fixed a production **OOM during a 6× traffic spike** (~350 → 2,195 req/min) by converting GraphQL DataLoaders from per-key to a single batched request — cutting MongoDB round-trips from **2N to 2** per request and ending the memory failures
- Eliminated dropped in-flight **POS card transactions** during Kubernetes scale-down by routing the HTTP-client lifecycle through SIGTERM and adding a SIGTERM-aware healthcheck — pods now finish in-flight /sales calls ~**2m15s** past shutdown (vs ~50s)
- Filled gaps across the stack — **WCAG 2.2** accessibility fixes in the React checkout SDK, a webpack 4→5 security upgrade clearing **17 critical/high CVEs**, and a Gradle-lockfile + Snyk SCA rollout across **19 services** (orchestrated with an agent swarm)

### Software Engineer, PayIt

Jan 2021 – Oct 2024

*Promoted from Associate; feature delivery, incident response, and platform modernization*

- Built org-wide **bulk transaction-resolution tooling** (React UI + payment-service batch endpoints) — now the entry point for incident and reconciliation workflows; resolved **15K+ transactions** and authored the engineering runbook
- Shipped end-to-end digital **DMV vision-form** support across 6 repositories, moving a previously offline Kansas renewal requirement fully online; built remittance and reconciliation reporting for **10+ government tenants** with scheduled report automation
- Migrated **14 services** to AWS Secrets Manager via the Kubernetes External Secrets Operator, removing in-repo secrets; ran production on-call across DMV, tax, licensing, and POS systems — **600+ incidents**

## LEADERSHIP

---

- Co-led PayIt's Code2College internship — interviewing, candidate evaluation, and mentorship for early-career engineers

## EDUCATION

---

### University of Kansas

2020

Bachelor of Science, Computer Science
